# Fragmentation in the Hambach forest (Germany)

- old forest and habitat for numerous species
- cleared for opencast lignite coal mine

# Fragmentation in the Hambach forest (Germany)

- old forest and habitat for numerous species
- cleared for opencast lignite coal mine

What is the effect of habitat connectivity on the population size of a single species?

# Research question

What is the effect of habitat connectivity on the population size of a single species?

Laboratory experiments

# Research question

What is the effect of habitat connectivity on the population size of a single species?

Laboratory experiments

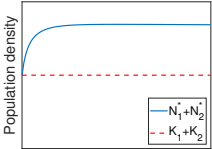

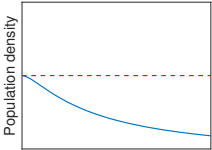

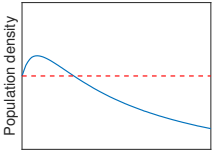

ODE model

# Study system

## Habitat quality:

- productivity ( $K$ )
- promote rapid population growth ( $r$ )

# r-K relationship

Positive r-K relationship ( $rK^+$ )	$K_i > K_j$	$r_i = K_i$ $r_j = K_j$	$r_i > r_j$	 <p>Population density</p> <p>Dispersal d</p> <p>— <math>N_1^* + N_2^*</math> - - <math>K_1 + K_2</math></p>
Negative r-K relationship ( $rK^-$ )	$K_i > K_j$	$r_i = K_i < r_j = K_j$	$r_i < r_j$	 <p>Population density</p> <p>Dispersal d</p>
Negative r-K relationship ( $rK^-$ )	$K_i > K_j$	$r_i = K_i < r_j = K_j$	$r_i > r_j$	 <p>Population density</p> <p>Dispersal d</p>

*Arditi et al. (2015), Theoretical Population Biology*

# Experimental design

- Model organism: *Escherichia coli*
- two growth environments
- Four different dispersal regimes

# Spatial Baranyi model

Population growth and dispersal:

$$\frac{dN_1}{dt} = \frac{Q_1}{1 + Q_1} r_1 N_1 \left( 1 - \frac{N_1}{K_1} \right) \quad d(N_1 \quad N_2)$$
$$\frac{dN_2}{dt} = \frac{Q_2}{1 + Q_2} r_2 N_2 \left( 1 - \frac{N_2}{K_2} \right) \quad d(N_2 \quad N_1)$$

With lag phase:

$$\frac{dQ_i}{dt} = r_i Q_i$$

Figure: Model calibration by independent growth kinetics

# Result

- dispersal decreases steady state population density compared to sum of carrying capacities

- dispersal decreases steady state population density compared to sum of carrying capacities
- first experimental evidence for negative r-K relationship ( $rK$ )

- dispersal decreases steady state population density compared to sum of carrying capacities
- first experimental evidence for negative r-K relationship ( $rK$ )
- generic approach

# Implications

- habitat connectivity reduces population size

# Implications

- habitat connectivity reduces population size
- condition: intraspecific competition stronger in lower quality habitat / lower  $K$  (and  $r$ )

# Implications

- habitat connectivity reduces population size
- condition: intraspecific competition stronger in lower quality habitat ! lower  $K$  (and  $r$ )
- r-K relationships in literature review:
  - $rK^+$  : 7 (2 strong)
  - $rK$  : 6 (4 strong)
  - $rK^-$  : 7 (3 strong)

# Back to Hambach forest

- habitat fragmentation generally includes habitat loss, habitat isolation and edge effects
- sometimes conflicting interests, e.g. due to demands for energy, mobility
- then: **site analysis** and **compensation**

# Compensating fragmentation effects

- e.g. by afforestation or dispersal corridors

- results question (cost-)effectiveness of dispersal corridors
- r-K relationship is not considered in the conservation literature

# THANK YOU!

For further questions and discussion,  
let's meet after the last talk for today  
(6 PM) in "Le Billard".

# Time series

# Literature review

**Table:** Empirical evidence for positive r-K relationships ( $rK^+$ ) and/or negative r-K relationships ( $rK^-$ ,  $rK^0$ ). x: evidence, **X**: most evidence (more than three times the number of examples or over thirty more examples), otherwise no evidence. Note that studies differ with respect to the number of tested r-K relationships.

Modeled species	Condition causing heterogeneity	$rK^+$	$rK^-$	$rK^0$	Reference
